Importing Modules 01

Creating Modules 02

Pip Instalation 03

Importing Modules

A module is a file that contains Python sefinitions and statements. They’re used for organization and reusability. try importing math.

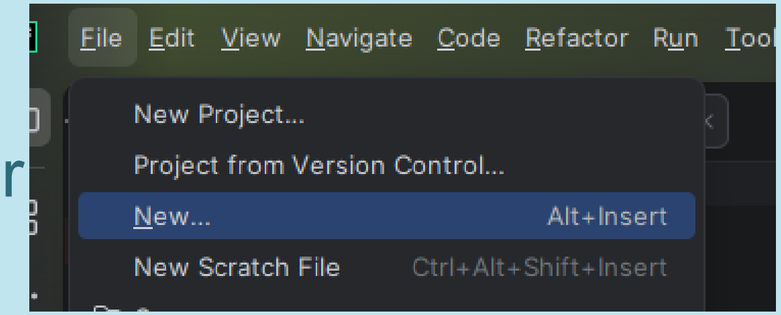

These are some pre-made modules: math, datetime, random, json, os, pathlib, and re.

```
math.sqrt(16)
math.pi
random.randint(1, 10)
random.choice(['apple', 'banana', 'cherry'])
datetime.date.today()
```

Activity Time!

Creating Modules

First you click this: ▤ in the top left corner of the screen.
Then click new, then new Python file
It should be the first option.
Name it and add the functions or other code that is need
When your done, go back to the main file and type in, import (your module's name)

Creating Modules

You an also only import specific funtions by typing,
from (your module's name) import (function name),
(next function name), etc

```
def add_numbers(a :{__add__}, b):  2+ usages
    return a + b
```

main.py | mat.py

```
1    from mat import add_numbers
2
3    sum = add_numbers( a: 3, b: 7)
4    print(sum)
```

```
10
```

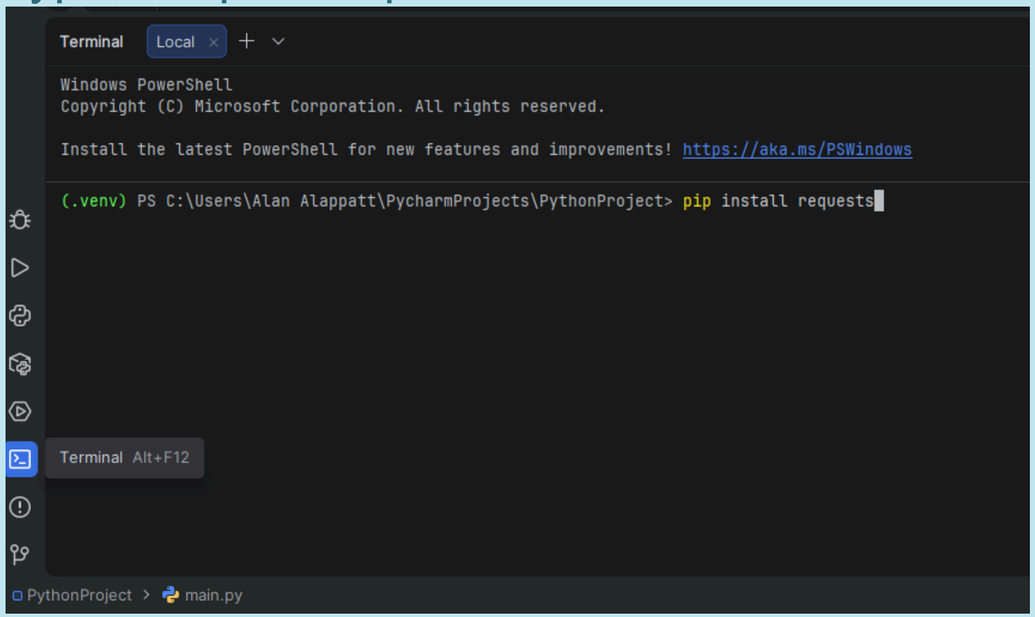

```
print(add_numbers( a: 3, b: 7))
```

Activity Time!

Pip installation

This is adding and downloading pre-made code into your project from the internet.

Go to the terminal and type, “pip install requests”
Then go back to the main.py file and
type, “import requests”

```python
import requests

try:
    print("Getting a random image")
    image_url = "https://picsum.photos/500/500"

    response = requests.get(image_url, timeout=10)

    response.raise_for_status()

    print("Saving the image")

    with open("downloaded_pic.jpg", "wb") as file:
        file.write(response.content)

except requests.exceptions.ConnectionError:
    print("\n Connection Error")

except requests.exceptions.HTTPError as http_err:
    print(f"\n Website Error: {http_err}")

except Exception as e:
    print(f"\n An unexpected error occurred: {e}")

finally:
    print("Attempted")
```

Activity Time!

Thank You!
